

Sensitivity contour plot under latent confounding (Regime B, §6.4)

Filled contours: bound $M(x) \cdot \delta(x)$ on $|B(x)|$ (Prop. 6.2.2). Dashed curve: the critical isoline $M \cdot \delta = |\mu_{\text{obs}}(x)|$ (Prop. 5.4.1) — above/right of it the sign of $\mu_{\text{obs}}(x)$ is no longer guaranteed. Diamond: δ as strong as the observed ρ_{XY} . Circles: δ at Kendall's $\tau = 0.10/0.20/0.30$.

$M(x)$ [outcome-sensitivity ceiling; Manski ceiling $\bar{y}=1$ at top]

$M(x) \cdot \delta(x)$
(bound on $|B(x)|$)
