

Sensitivity to extreme scenarios (Cinelli-Hazlett Fig. 3, reproduced), $x=0.25$

Solid black: confounder's outcome-sensitivity assumed at its full, assumption-free ceiling $M(x)=\bar{y}$ (worst case, Prop. 5.4.2). Blue/pale: willing to additionally assume $M(x)$ is only 75%/50% of that ceiling. Horizontal line: where the adjusted estimate crosses zero.
